

**l-value:**

-----

\*.In computer science, a value that points to a storage location, potentially allowing new values to be assigned.

**r-value:**

-----

\*.In computer science, a value considered independently of its storage location.

**\*.variable:**

-----

\*.the variables are called symbolic variables because these are named loctions. the declaration of a variable in c informs about:

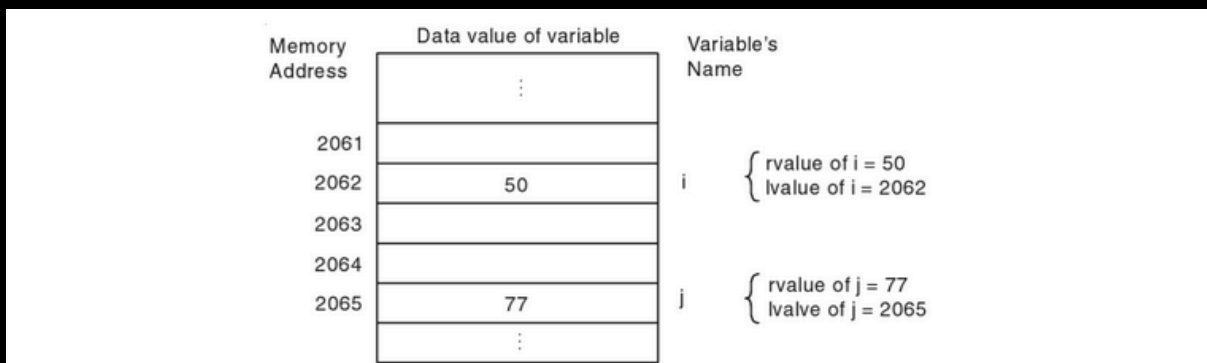

\*.there are two values associated with a *symbolic variables*:

1.its **data value**, stored at some location in memory. it is sometimes referred to as a variables **rvalue** .

2.its **location value**; i.e., the address in memory where the data is stored. it is sometimes referred to as variable's **lvalue**.

**Methaphore:**

-----

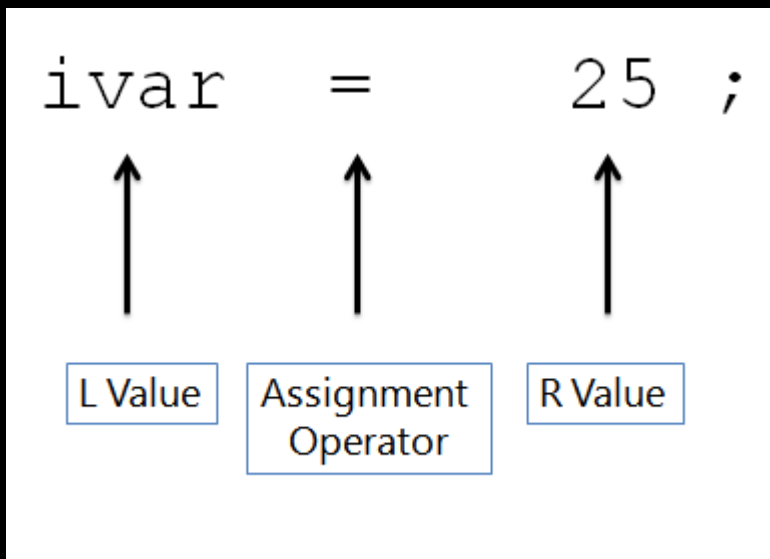

**Fig. 5.** The rvalue and lvalue of a variable

An *lvalue* is an expression to which you can assign a value. The left of an = (assignment operator) must be an lvalue.

**Note :** Remember that constant values and constant identifiers (declared using *const* keyword) are not lvalues and can only appear to the right side of an assignment operator.

Simple convention:

-----

Compile time errors only:

```
*.int arr[10];
  error: lvalue required as increment operand
  arr++;
  ^

*.5 = 9;
  error: lvalue required as left operand of assignment
  5 = 9;
  ^

*.int a = 9;
  5 = i;
  error: lvalue required as left operand of assignment
  5 = val;
  ^

*.instead of
  if(0 == x)    //works correctly

  if(0 = x)    // lvalue required as left operand of assignment

*.(val+1) = 9;
  error: lvalue required as left operand of assignment
  (val+1) = 9;
  ^
```

```
*.&n = 1000;  
error: lvalue required as left operand of assignment  
&val = 1000;  
  ^
```
